9	Natalka	3,2	Au-Q	Yana-Kolyma, MZ <sub>3</sub>
10	Svetloye	3,0	Au-Q	Yana-Kolyma, MZ <sub>3</sub>
	<b>Total</b>	<b>88,2</b>	<b>Historical total (1900-2009)</b>	<b>2000 t (about 300 t from lodes)</b>

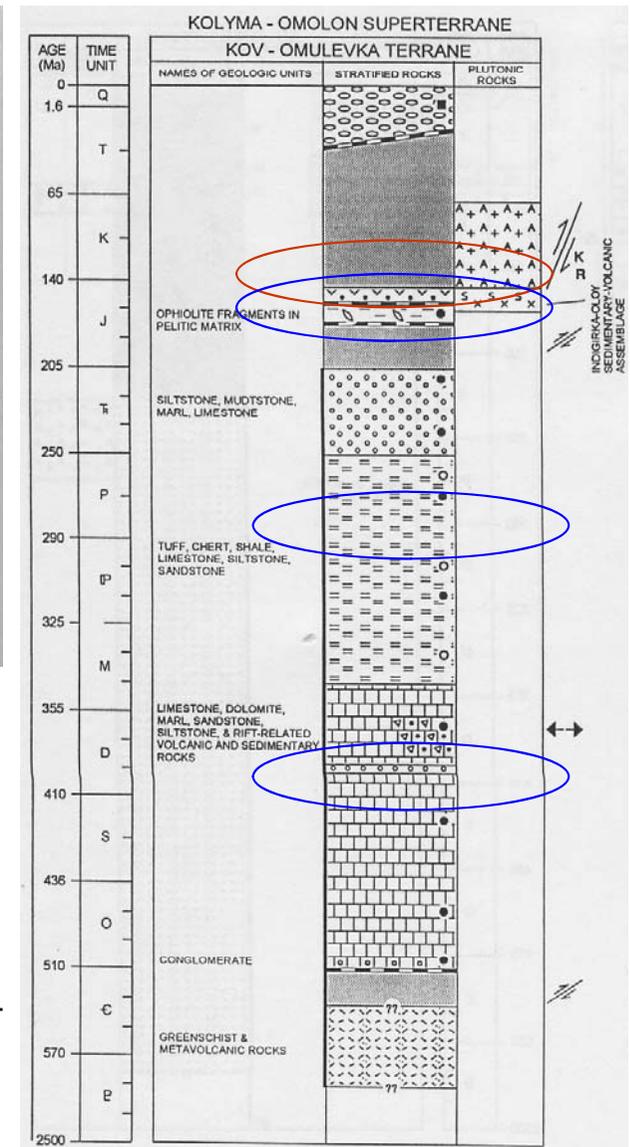

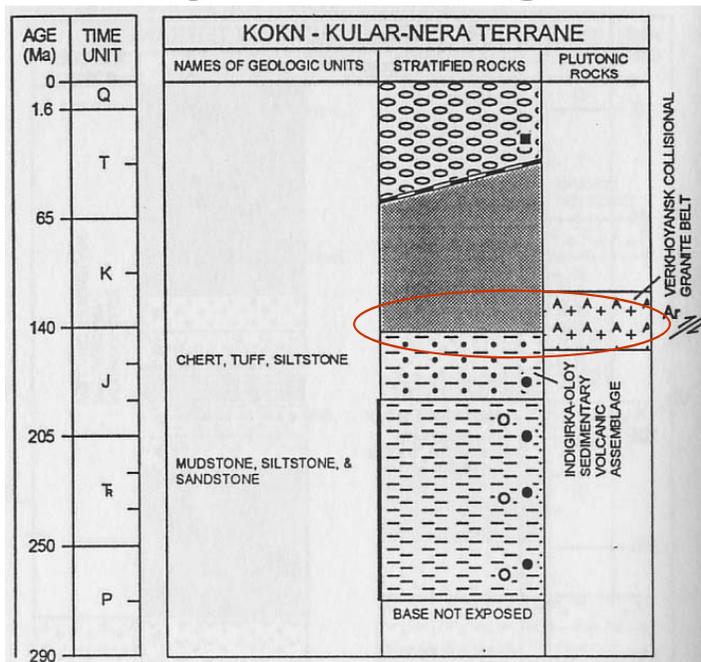

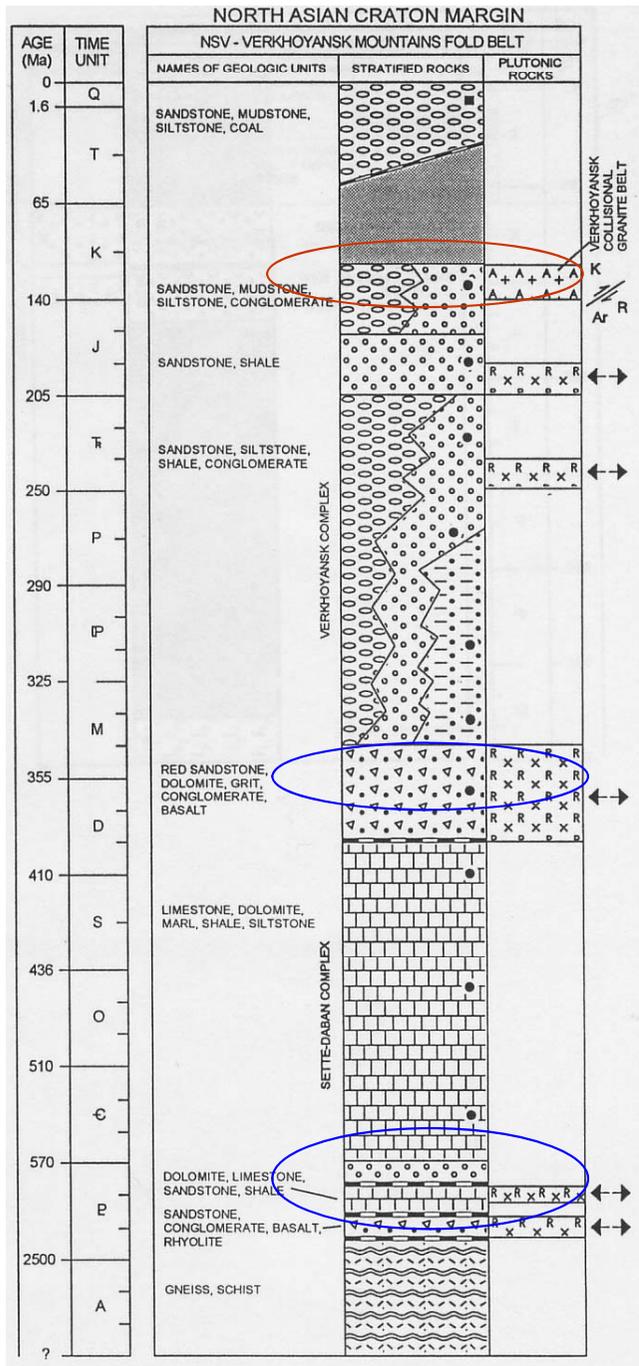

# Magadan Region – General Metallogeny

1. **three major periods in metallogenic history of the Magadan Region and Russian North East : (1) pre-accretionary – pre-Late Mesozoic (main ore deposits of Cu, Pb, Zn, Au and Fe); (2) orogenic – Late Mesozoic (Au, Sn, W), and (3) post-accretionary – Late Mesozoic – Cenozoic (Ag, Au, Sn, Mo). But the typical ones for this territory are lode deposits of gold, silver, tin, tungsten, copper, zinc, molybdenum.**

2. **Geological factors affecting the distribution of lode deposits are as follows: for Au, Sn – terrigenous host rocks and orogenic granitoid associated, or volcanic belts; for Pb-Zn-Cu –terrigenous and carbonate host rocks and riftogenic basalts associated; Ag – volcanic belts and perivolcanic zones are characterized by Au-Ag and Ag-Sn deposits, but the back arc setting is more characterized by Ag-Sb and Ag-Pb-Zn deposits.**

# Yana-Kolyma orogenic belt

Major orogenic event - Late Jurassic – Early Cretaceous (dislocations, zoned metamorphism, granitoid intrusion).

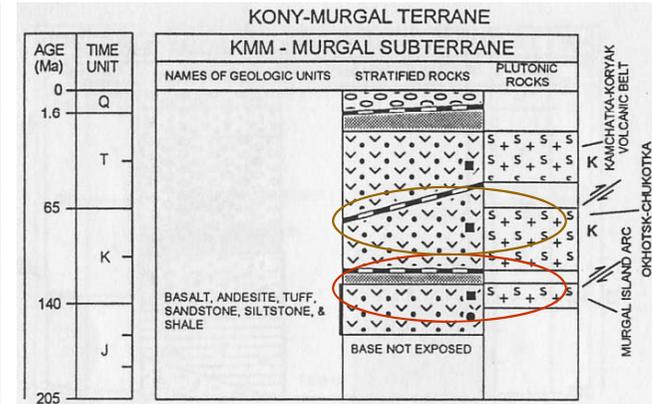

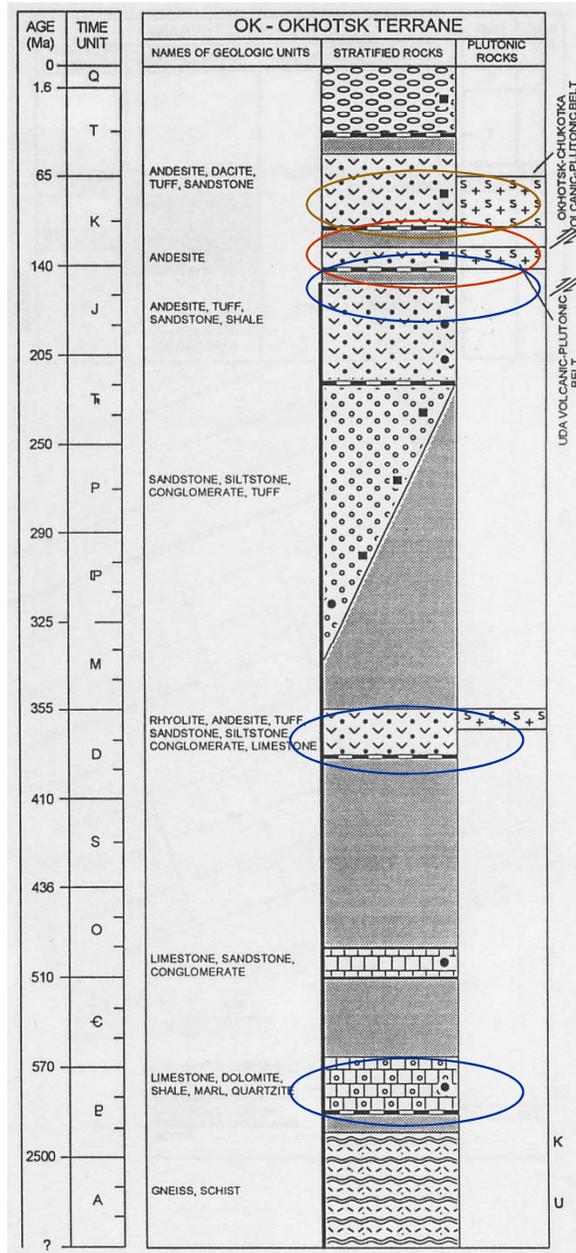

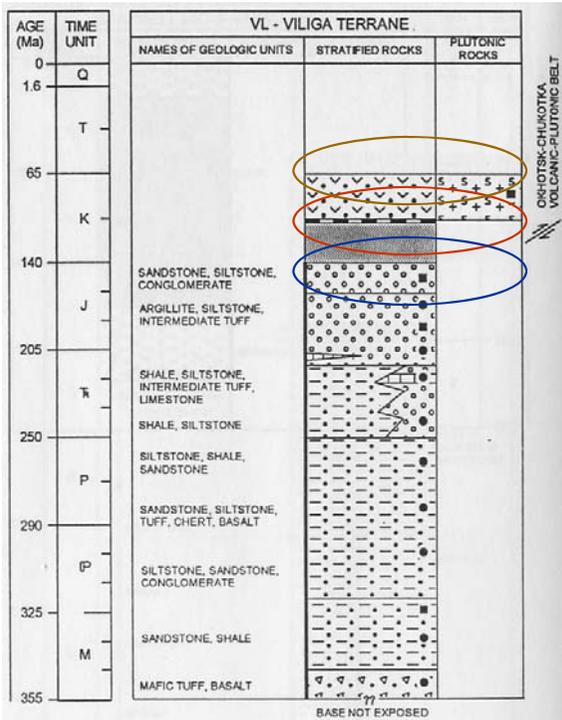

The time of intrusion of the collisional granitoids (Main Kolyma granitoid belt, according to SHRIMP data, 149-153 Ma – Akinin et al., 2006; Ar-Ar data: 137-149 Ma – Newberry et al., 2000, Leyer et al., 2001)

The positions of ore deposits and metallogenic levels of different metallogenic epochs in tectonic-stratigraphic columns of major tectonic blocks of the Yana-Kolyma orogenic belt

Orogenic ores – Au, Sn, W

Pre-accretionary ores – Cu, Pb, Zn

# Okhotsk-Koryak orogenic belt

Major orogenic event - Early Cretaceous (dislocations, zoned metamorphism, granitoid intrusion).

The time of intrusion of the collisional granitoids, according to K-Ar data, 134-110 Ma – Akinin, Kotlyar, 2001)

The positions of ore deposits and metallogenic levels of different metallogenic epochs in tectonic-stratigraphic columns of major tectonic blocks of the Okhotsk-Koryack orogenic belt

Orogenic ores – Au, Sn, Co, Li, Be

Pre-accretionary ores – Cu, Mo, Au-Ag

Post-orogenic ores – Au, Ag, Sn, W, Mo, Cu, U

# Magadan Region – General Metallogeny

**3. Metallogenic characteristics of the major volcanogenic belts of the Magadan Region of North-East of Russia are:**

**(1) Pre-accretionary**

**Uyandina-Yasachnensky island arc belt: Ag-Cu-Pb,Zn-Au  
(carbonate basement)**

**Uda-Murgal continental margin belt: Au-Ag-Cu-Mo-Co  
(volcanic-terrigenous basement)**

**Back arc metallogeny: Ag-Sb-Au-Pb-Zn**

**4. Metallogenic characteristics of the major orogenic belts of the Magadan Region of North-East of Russia are:**

**(1) Yana-Kolyma belt: Au-W-Sn-(Pb,Zn,Mo) predominantly terrigenous shelf terranes;**

**(2) Okhotsk-Koryak belt: Sn-Au-Co-Li-Be predominantly terrigenous shelf terranes and volcanoclastic sediments back arc.**

**5. Metallogenic characteristics of the major post-accretionary belt of the Magadan Region of North-East of Russia are:**

**Okhotsk-Chukotka continental margin belt: Au-Ag-Sn-W-Mo (terrigenous and metamorphic basement, rarely volcanic)**

**Back arc metallogeny: Ag-Sn-Sb-Au-Pb-Zn-Mo**

# Major Lode Deposits Types

The total mining production is estimated today as about 4 kt Au (mainly recovered from placers), 90 kt Sn, 40 kt W, 2 kt Ag, 30? kt Sb, and 1 kt Co.

# Types of the Gold Lodes of Magadan Area

**Gold-sulfide-disseminated and veinlets zones (early orogenic – Degdekan, Nataalka)**

**Gold-quartz (early orogenic veins, late orogenic veins, granitoid hosted, and shear zones – Svetloye, Utinka, Igumenovskoye)**

**Granitoid-related (skarns, greisens and veins – Chistoye, Teutedzhak)**

**Gold-silver epithermal (pre-, and post-accretionary – Julietta, Karamken)**

**tionary)**

Igumen creek placer – the overall production has been more than 30 t Au

# GOLD DEPOSITS OF MAGADAN REGION

Major Au lodes are localized in terrigenous sediments of Verkhoyan passive continental margin, Kular-Nera slate belt, Chukotka and Viliga shelf Terrane (collisional setting), and in volcanic rocks of Uda-Murgal and Okhotsk-Chukotka continental margin magmatic belt (subduction setting).

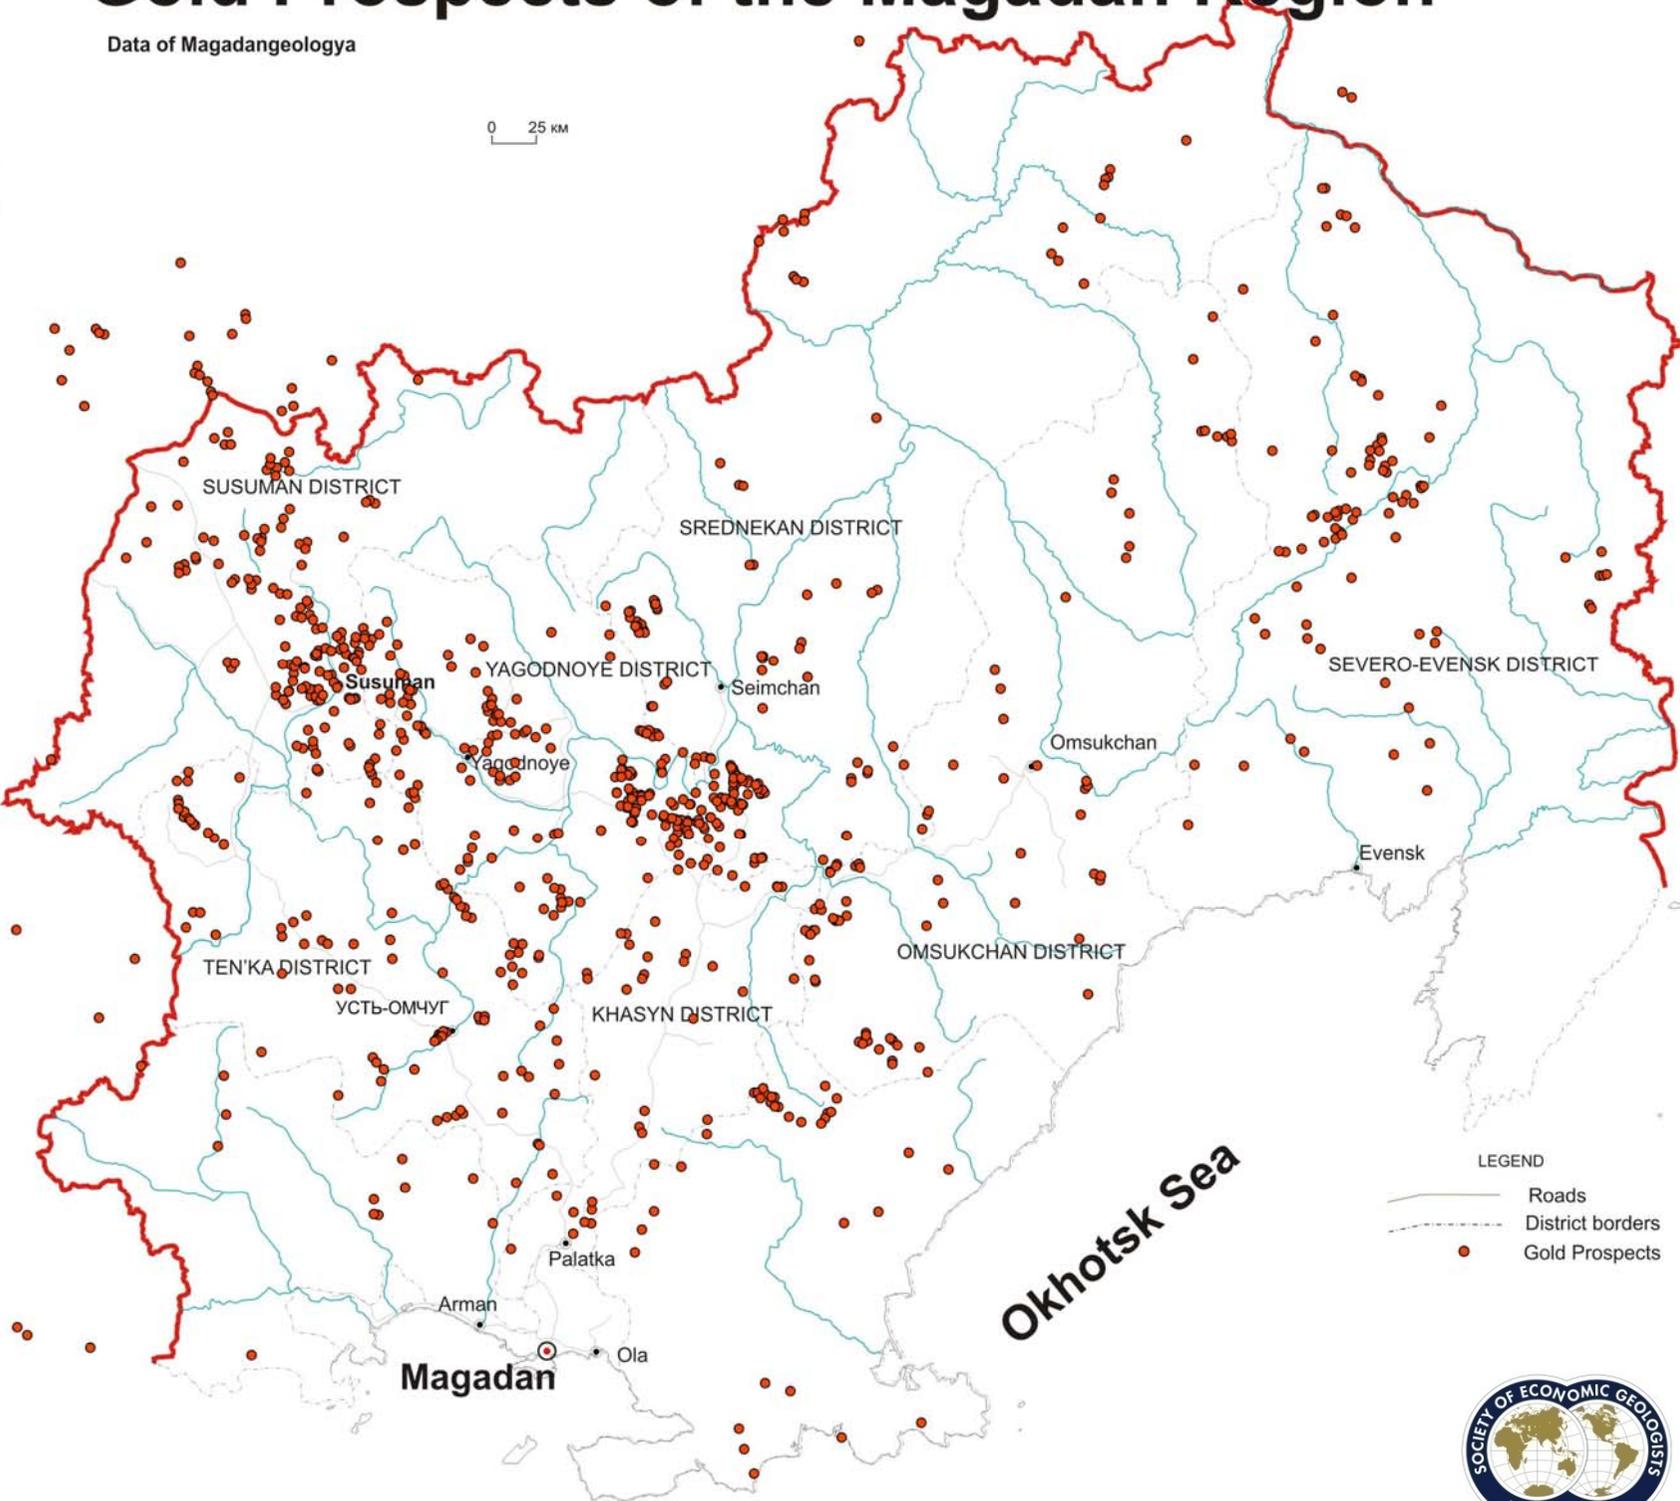

# Gold Prospects of the Magadan Region

Data of Magadangeologya

0 25 KM

Major Au lodes are localized in terrigenous sediments of Verkhoyan passive continental margin, Kular-Nera slate belt, Chukotka and Viliga shelf Terrane (collisional setting), and in volcanic rocks of Uda-Murgal and Okhotsk-Chukotka continental margin magmatic belt (subduction setting).

# Where are High-Sulphidation Au-Ag epithermal lode deposits in Magadan Region?

# Distribution of major Ag lode deposits

## Silver lode deposit types

- Ag-Au epithermal
- Ag-Sn subvolcanic
- Ag-base metallic
- Ag-Co-arsenide
- Ag-Sb

## SILVER DEPOSITS OF MAGADAN REGION

Major Ag lodes are localized in terrigenous sediments of Verkhoyan passive continental margin, Kular-Nera slate belt and Viliga terrane (back arc setting), and in volcanic rocks of Uda-Murgal and Okhotsk-Chukotka continental margin magmatic belt.

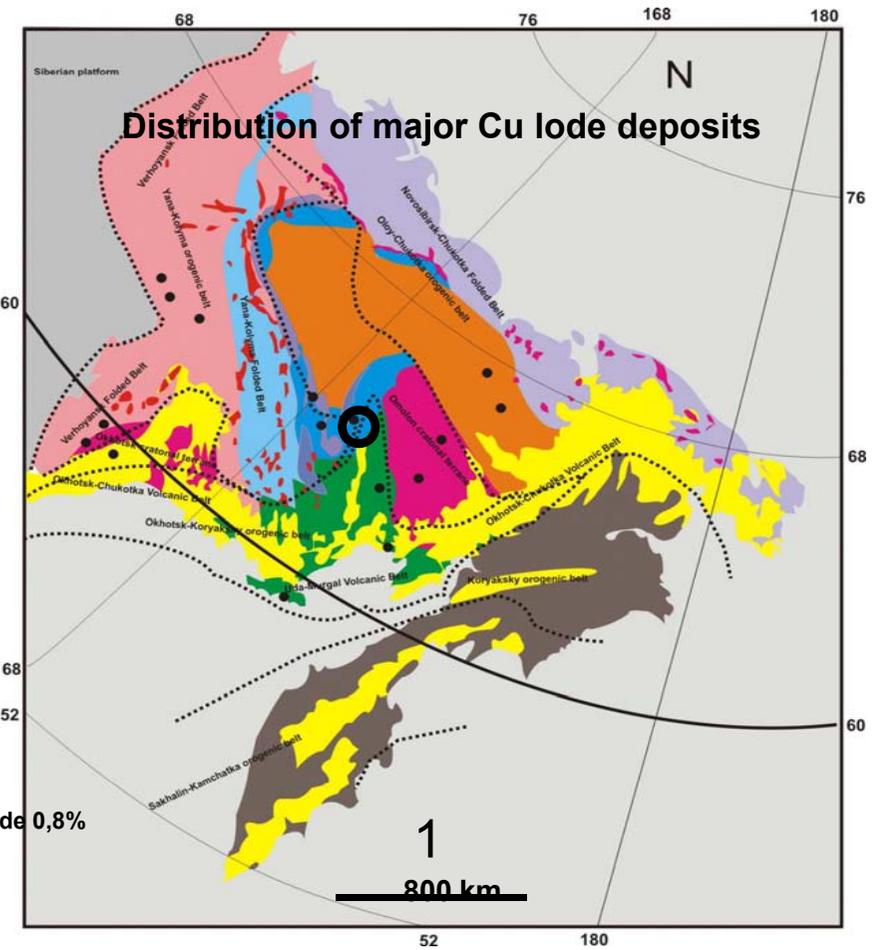

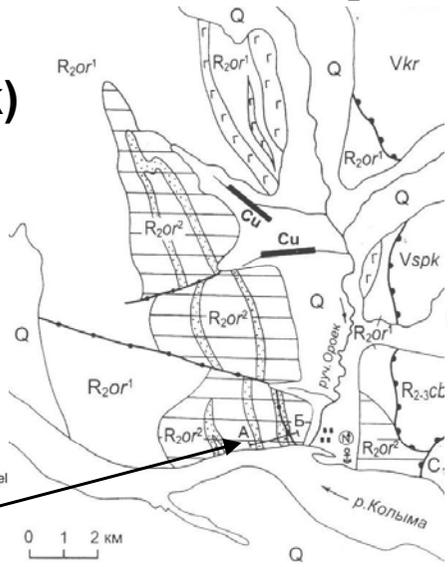

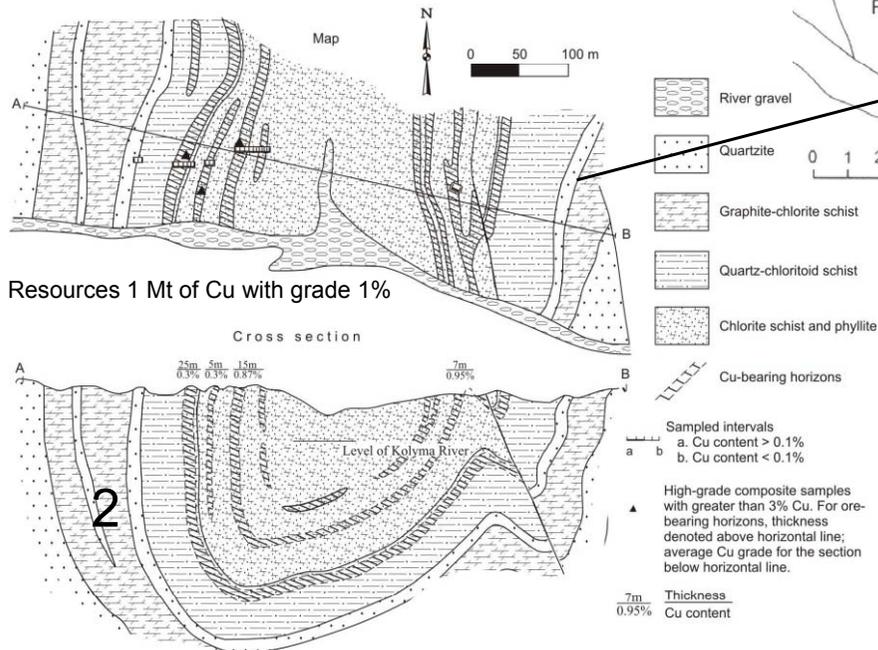

# Copper lode deposit types

**Cu-sandstone and shists (Oroek)**

**Cu-Mo-porphyry (Lora)**

**Cu-Mo skarns (Medgora)**

Resources 10 Mt of Cu with grade 0,8%

**Major Cu lodes are localized in terrigenous-carbonate sediments and Devonian basalts of Verkhoyan passive continental margin and Omulevka terrane. Cu-Mo porphyry and skarns are localized in Mesozoic island arc and back arc terranes and settings**

Figure 5. Oroek sediment-hosted Cu deposit, Oroek metallogenic belt, Russian Northeast. Schematic geologic map and cross section for southern part of deposit. Adapted from Shpikerman (1996). Nokleberg et al., 2005

- The Magadan Area of the Russian North-East are characterized by many lode deposits. But the typical ones of this territory are lode deposits of gold, silver, tin, tungsten, copper, zinc, molybdenum, cobalt.
- Lode deposits of iron, rare and earth elements, lead, antimony, mercury and other elements are less frequent.

# Conclusion

## Exploration Perspectives in Magadan Region

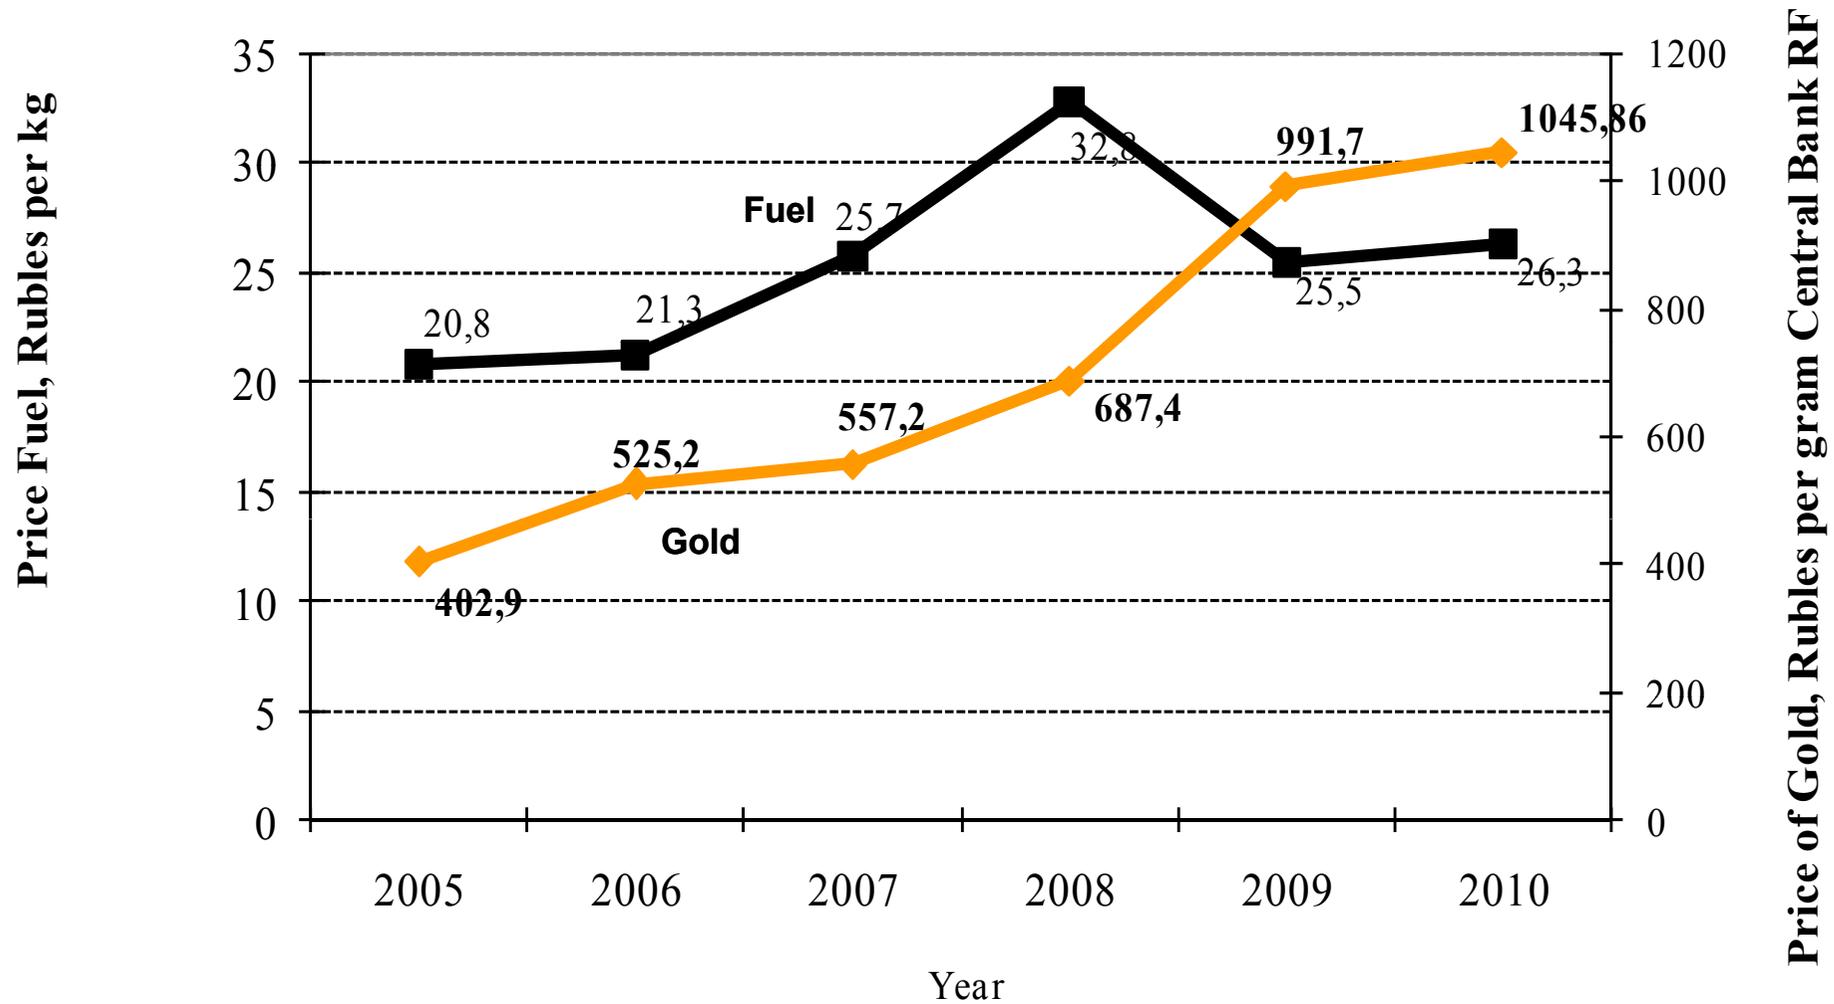

Good perspectives are:

- (1) high mineral potential;
- (2) employers – Magadan State University,
- (3) developed infrastructure;
- (4) deep water see port Magadan;
- (5) good perspective oil in shelf;
- (6) good resources of coal;
- (7) low regional price of electrical power;
- (8) long-lived Russian government plans for road construction in North East Russia

and others
